

LaTeX commands are preceded by a backslash character (\). Those command names should not be translated, and their arguments (in \) sometimes should not be, neither. Below is list of arguments that should not be translated (*except* for those in **color**).

- ▶ `\newglossaryentry{<keyword>}{name={<term>}, description={<definition>}, plural={<plural form>}}`
- ▶ `\gls{<keyword>} \glspl{<keyword>}`
- ▶ `\Gls{<keyword>} \Glspl{<keyword>}`
- ▶ `\label{<label>}`
- ▶ `\ref{<label>} \pageref{<label>} \nameref{<label>}`
- ▶ `\chapl原因{<label>} \seclink{<label>}`
- ▶ `\begin{<name>} \end{<name>}`
- ▶ `\providecommand{<name>}{<definition>}`
- ▶ `\documentclass[options]{<document type>}`
- ▶ `\screenshot{<filename>}{<label>}{<caption>}`
- ▶ `\url{<URL>}`
- ▶ `\include{<file>}`
- ▶ `\todo{<some text>}`
- ▶ `\screenshotTODO{<some text>}`

Commands and arguments should always be copied/pasted if you are not familiar to LaTeX, as this avoids some typos. Some characters look alike in sans serif fonts but they are not the same (*i. e.* l (small L) and I (capital I) are different).

For quotation marks, leave them as-is: `` '' become “ ” when rendering in LaTeX.
